SUMM   The invention relates to skin care compositions containing an
```

amide of a hydroxy fatty acid and a **retinoid**, preferably **retinol** or **retinyl ester**.

SUMM **Retinol** (vitamin A) is an endogenous compound which occurs naturally in the human body and is essential for normal epithelial cell differentiation. Natural and synthetic vitamin A derivatives have been used extensively in the treatment of a variety of **skin** disorders and have been used as **skin** repair or renewal agents. **Retinoic acid** has been employed to treat a variety of **skin** conditions, e.g., acne, wrinkles, psoriasis, age spots and discoloration. See e.g., Vahlquist, A. et al., J. Invest. Dermatol., Vol. 94, Holland D. B. and Cunliffe, W. J. (1990), pp. 496-498; Ellis, C. N. et al., "Pharmacology of **Retinols** in **Skin**", Vasel, Karger, Vol. 3,(1989), pp. 249-252; Lowe, N. J. et al., "Pharmacology of **Retinols** in **Skin**", Vol. 3, (1989), pp. 240-248; PCT Patent Application No. WO 93/19743. It is believed that the use of **retinol** or esters of **retinol** would be preferred over **retinoic acid**. **Retinol** is an endogenous compound which occurs naturally in the human body and is essential for normal epithelial cell differentiation. **Retinol** is also considered much safer than **retinoic acid**. Esters of **retinol** hydrolyze in-vivo to produce **retinol**. **Retinol** and **retinyl esters** are considered safer than **retinoic acid**. Unfortunately, **retinol** and **retinyl esters** are less effective than **retinoic acid** at providing **skin** benefits. The present invention is based, in part, on the discovery that a combination of **retinol** or **retinyl esters** with amides of hydroxy fatty acids results in a synergistic inhibition in keratinocyte differentiation. The effects of hydroxy fatty acid amides combined with **retinol** or a **retinyl ester** were analogous to the effects of **retinoic acid**. Thus, a mixture of hydroxy fatty acid amides with **retinol** or **retinyl esters** mimics **retinoic acid** yet is easier and safer to use than **retinoic acid**.

SUMM . . . from about 0.025% to about 35% of a monocarboxylic fatty acid, ester, or amide. The compositions may also include a **retinoid**. Thornfeldt teaches that certain **retinoids**, namely isotretinoin, tretinoin, etretin (all of which are stereoforms of **retinoic acid**) and etretinate (an ester of trimethoxyphenyl **retinoic acid**) have proven efficacy against papulosquamous diseases. PCT Application WO/9325177 (Proctor and Gamble) discloses compositions for topical application to **skin** which contain a specific type of acyclic carboxamide coolant and may include **retinoids** such as **retinoic acid** and its derivatives (e.g., cis and trans). PCT application WO/9403156 (Rhone Poulenc) discloses a topical composition containing linoleic acid or a derivative as an active ingredient for treatment and prophylaxis of impure **skin** (e.g., **skin** affected by pimples, pustules, or comedones); the composition may also contain 0.025-0.1 wt. % of tretinoin. European Patent Application No.. . .

SUMM . . . (U.S. Pat. No. 5,216,148) disclose the use of specific complex carboxamides for treating and preventing neoplasms, dermatoses, and aging of **skin**. Van Scott et al. (U.S. Pat. No. 4,380,549) and Yu et al., (U.S. Pat. No. 4,363,815) disclose treatment of acne, dry, flaky, scaly **skin** with a hydroxyacid or the amide thereof. EP

0 582 458 discloses use of N,N-(1,4C alkyl) lauramide. EP 0 559 304 disclose the use of an amide containing a hydrocarbyl chain of at least 25 carbon atoms as a **skin** smoothening agent. Beauquey et al. (U.S. Pat. No. 5,308,551) disclose a **skin** washing and conditioning composition containing, among other ingredients, a 1-4 C alkanolamide of a 8-16 C fatty acid. Great Britain. . .

SUMM The art cited above does not disclose **skin** conditioning compositions based on synergistic combinations of hydroxy fatty acid amides with **retinol** or a **retinyl ester**.
None of the art cited above addresses the need for an effective alternative to **retinoic acid**.

SUMM The present invention includes, in part, a **skin** conditioning composition containing:

SUMM (a) from about 0.001% to about 10% of a **retinoid** selected from the group consisting of **retinol**, a **retinyl ester**, and **retinoic acid**;

SUMM The term "conditioning" as used herein means prevention and treatment of
dry **skin**, photodamaged **skin**, appearance of wrinkles, age spots, aged **skin**, acne, **skin** lightening, psoriasis, atopic dermatosis, controlling sebum excretion, increasing stratum corneum flexibility, and generally increasing the quality of **skin**. The composition may be used to improve **skin** desquamation and cellular proliferation.

SUMM The presence of a hydroxy fatty acid amide in the inventive product substantially improves the performance of **retinol** or a **retinyl ester**, i.e., a hydroxy fatty acid amide substantially increases the ability of **retinol** or a **retinyl ester** to affect cellular proliferation. A hydroxy fatty acid amide has no or little effect on improving **skin** benefit when used alone; a substantial increase in **skin** benefit is only realized when a hydroxy fatty acid amide is combined with **retinol** or a **retinyl ester**.
In short, the present invention is based, at least in part, on the discovery of synergistic interaction between **retinol** or a **retinyl ester** and a hydroxy fatty acid amide.

SUMM In a preferred embodiment of the invention, a **retinoid** is selected from the group consisting of **retinol** or a **retinyl ester**. According to the present invention, by virtue of including an effective amount of a hydroxy fatty acid amide into compositions containing **retinol** or a **retinyl ester**, the performance of the compositions is substantially improved. Alternatively, lower levels of **retinol** or a **retinyl ester** may be included in the composition containing a hydroxy fatty acid amide to equal the performance of a similar formulation. . .

SUMM The inventive compositions contain, as a first essential ingredient, a compound selected from the group consisting of **retinol** or a **retinyl ester**.

SUMM The term "**retinol**" includes the following isomers of **retinol**: all-trans-**retinol**, 13-cis-**retinol**, 11-cis-**retinol**, 9-cis-**retinol**, 3,4-didehydro-**retinol**. Preferred isomers are all-trans-**retinol**, 13-cis-**retinol**, 3,4-didehydro-**retinol**, 9-cis-**retinol**. Most preferred is all-trans-**retinol**, due to its wide commercial availability.

SUMM **Retinyl ester** is an ester of **retinol**. The term "**retinol**" has been defined above. **Retinyl esters** suitable for use in the present invention are C.sub.1 -C.sub.30 esters of **retinol**, preferably C.sub.2 -C.sub.20

esters, and most preferably C.sub.2, C.sub.3, and C.sub.16 esters because they are more commonly available. Examples of **retinyl esters** include but are not limited to: retinyl palmitate, retinyl formate, retinyl acetate, retinyl propionate, retinyl butyrate, retinyl valerate, retinyl isovalerate,. . .

SUMM . . . selected from retinyl palmitate, retinyl acetate and retinyl propionate, because these are the most commercially available and therefore the cheapest. **Retinyl ester** is also preferred due to its efficacy.

SUMM The **retinoid** is employed in the inventive composition in an amount of from about 0.001% to about 10%, preferably in an amount. . .

SUMM . . . for the active components in the composition, so as to facilitate their distribution when the composition is applied to the **skin**.

SUMM Optional **Skin** Benefit Materials and Cosmetic Adjuncts

SUMM . . . invention. Various types of active ingredients may be present in cosmetic compositions of the present invention. Actives are defined as **skin** or hair benefit agents other than emollients and other than ingredients that merely improve the physical characteristics of the composition.. . .

SUMM Yet another preferred optional ingredient is selected from azoles, e.g., **climbazole**, bifonazole, clotrimazole, ketoconazole, miconazole, econazole, itraconazole, fluconazole, terconazole, butoconazole, sulconazole, lionazole and mixtures thereof.

SUMM The composition according to the invention is intended primarily as a product for topical application to human **skin**, especially as an agent for conditioning and smoothening the **skin**, and preventing or reducing the appearance of wrinkled or aged **skin**.

SUMM . . . a small quantity of the composition, for example from 1 to 5 ml, is applied to exposed areas of the **skin**, from a suitable container or applicator and, if necessary, it is then spread over and/or rubbed into the **skin** using the hand or fingers or a suitable device.

SUMM The topical **skin** treatment composition of the invention can be formulated as a lotion, a fluid cream, a cream or a gel. The. . .

DETD The following specific examples further illustrate the invention, but the invention is not limited thereto. **Retinoids** were obtained from Sigma.

DETD **Retinoic acid** is more effective than **retinol** at altering keratinocyte differentiation state

DETD The effect on Transglutaminase levels normalized to DNA content of the cells after addition of **retinoic acid** and **retinol** was examined and the results are shown in Table 1.

DETD All concentrations of **retinoic acid** tested, i.e., 2.5.times.10.sup.-7 M, 2.5.times.10.sup.-8 M and 2.5.times.10.sup.-9 M decreased keratinocyte differentiation over both the ethanol control and did so to a significantly greater extent than each of the corresponding 2.5.times.10.sup.-7 M, 2.5.times.10.sup.-8 M and 2.5.times.10.sup.-9 M **retinol** treatments. The decrease in transglutaminase level was dose dependent for both **retinoic acid** and **retinol**. This is consistent with **retinoic acid** having a greater inhibitory effect on epithelial differentiation than **retinol**.

DETD Amides of hydroxy fatty acids and **retinol** act synergistically

to repress keratinocyte differentiation

DETD TABLE 2A

Effect of **Retinol** And C.sub.13 .beta.-Hydroxy Acid Amide On Keratinocyte TGase/DNA

	mean TGase/	p value vs.	p value vs 10.sup.-6	p value vs vs 10.sup.-6
	(100%)	--	0.001	. . . -- 0.001
2.5 .times. 10.sup.-8 M RA	1.05 .+-. 1.05 (6%)	0.001	0.001	-- 0.001
2.5 .times. 10.sup.-8 M **Retinol**	14.62 .+-. 2.99 (79%)	0.001	-- 0.001	0.001
10.sup.-8 M C13-.beta.-hydroxy-acid amide	18.53 .+-. 4.58	0.875	0.001	0.001 --
	(101%)			
2.5 .times.. . .				

DETD 2.5.times.10.sup.-8 M **retinoic acid** was very effective at repressing keratinocyte TG1 levels (to 6%) of control level. 2.5.times.10.sup.-8 M **retinol** was less effective than **retinoic acid** (79%) and 10.sup.-8 M C13 .alpha.-hydroxy-acid amide had no inhibitory effect on the keratinocyte TG1 level when used alone. However 2.5.times.10.sup.-8 M **retinol** +10.sup.-8 M C13 .alpha.-hydroxy-acid amide repressed keratinocyte TG1 to 62% of control levels. C13 .alpha.-hydroxy-acid amide and **retinol** therefore act synergistically to repress keratinocyte differentiation in an analogous manner to the effect of **retinoic acid**.

DETD TABLE 2B

Effect Of **Retinol** And Lactamide MEA On Keratinocyte Differentiation

	mean TGase/	p value vs	p value vs vs 10.sup.-6	p value vs vs 10.sup.-6

0.054
0.049
--
2.5 .times. 10.sup.-7. . .

DETD 2.5.times.10.sup.-7 M **retinoic acid** was effective at repressing keratinocyte TG1 levels (to 73%) of control level. 2.5.times.10.sup.-7 M **retinol** and 10.sup.-6 M lactamide-DEA were less effective at inhibiting keratinocyte TG1 level when used alone. However 2.5.times.10.sup.-7 M **retinol** +10.sup.-6 M lactamide-DEA repressed keratinocyte TG1 to 72% of control levels. Lactamide-DEA and **retinol** therefore act synergistically to repress keratinocyte differentiation in an analogous manner to the effect of **retinoic acid**.

DETD Examples 1 and 2 demonstrate that **retinoic acid**, in a dose dependent manner, decreased keratinocyte differentiation. In Examples 1 and 2, **retinoic acid** was used as positive control and reference compound against which the other compounds under analysis were compared. **Retinol** was completely ineffective at decreasing keratinocyte differentiation.

DETD The unexpected results of Examples 1 and 2, however, were that the effect of **retinol** on cultured keratinocytes can be enhanced to levels approaching those of **retinoic acid** by combining **retinol** or **retinyl ester** with an amide of hydroxy fatty acid --a compound which exerts little or no benefit on its own. The results documented above demonstrate that an amide of hydroxy fatty acid acts synergistically with **retinol** or **retinyl ester**, to decrease keratinocyte differentiation, mimicking the effect of **retinoic acid**

.

DETD This example illustrates a non-aqueous **skin** care composition incorporating the inventive combination. ##STR10##

CLM What is claimed is:

1. A **skin** conditioning composition comprising (a) from about 0.001% to about 10% of **retinol**; (b) from about 0.0001% to about 50% of an amide of a hydroxy fatty acid selected from the group consisting. . .

2. A method of treating a **skin** condition selected from the group consisting of dry **skin**, photodamaged **skin**, wrinkles, age spots, aged **skin**, acne, **skin** lightening, psoriasis and atopic dermatosis, the method comprising applying to the **skin** the composition of claim 1.

TI **Skin** care compositions containing a polycyclic triterpene
carboxylic acid and a **retinoid**
PI US 5723139 19980303 <--
AB A polycyclic triterpene carboxylic acid in combination with either
retinol or **retinyl ester** resulted in a
synergistic inhibition of keratinocyte differentiation. The effects of
polycyclic triterpene carboxylic acids in combination with
retinol or **retinyl ester** were analogous to
the treatment with **retinoic acid**.
SUMM The invention relates to **skin** care compositions containing a
polycyclic triterpene carboxylic acid and a **retinoid**,
preferably **retinol** or **retinyl ester**.
SUMM **Retinol** (vitamin A) is an endogenous compound which occurs
naturally in the human body and is essential for normal epithelial cell
differentiation. Natural and synthetic vitamin A derivatives have been
used extensively in the treatment of a variety of **skin**
disorders and have been used as **skin** repair or renewal agents.
Retinoic acid has been employed to treat a variety of
skin conditions, e.g., acne, wrinkles, psoriasis, age spots and
discoloration. See e.g., Vahlquist, A. et al., J. Invest. Dermatol.,
Vol, 94, Holland D. B. and Cunliffe, W. J. (1990), pp. 496-498; Ellis,
C. N. et al., "Pharmacology of **Retinols** in **Skin**",
Vasel, Karger, Vol. 3, (1989), pp. 249-252; Lowe, N.J. et al.,
"Pharmacology of **Retinols** in **Skin**", Vol. 3, (1989),
pp. 240-248; PCT Patent Application No. WO 93/19743. It is believed
that
the use of **retinol** or esters of **retinol** would be
preferred over **retinoic acid**. **Retinol** is
an endogenous compound which occurs naturally in the human body and is
essential for normal epithelial cell differentiation. **Retinol**
is also considered much safer than **retinoic acid**.
Esters of **retinol** hydrolyze in-vivo to produce **retinol**
. **Retinol** and **retinyl esters** are
considered safer than **retinoic acid**. The present
invention is based, in part, on the discovery that a combination of
retinol or a **retinyl ester** with a polycyclic
triterpene carboxylic acid (hereinafter "PTCA") results in a
synergistic
inhibition of keratinocyte differentiation. The effects of PTCA
combined

with **retinol** or a **retinyl ester** were analogous to the effects of **retinoic acid**. Thus, a mixture of PTCA with **retinol** or **retinyl esters** mimics **retinoic acid** yet is easier and safer to use than **retinoic acid**.

SUMM The present invention includes, in part, a **skin** conditioning composition containing:

SUMM (a) from about 0.001% to about 10% of a **retinoid** selected from the group consisting of **retinol**, a **retinyl ester**, and mixtures thereof;

SUMM The term "conditioning" as used herein means prevention and treatment of dry **skin**, photodamaged **skin**, appearance of wrinkles, age spots, aged **skin**, acne, **skin** lightening psoriasis, atopic dermatosis, increasing stratum corneum flexibility, controlling sebum excretion and generally increasing the quality of **skin**. The composition may be used to improve **skin** desquamation and cellular proliferation.

SUMM The presence of PTCA in the inventive product substantially improves the performance of **retinol** or a **retinyl ester**, i.e., PTCA substantially increases the ability of **retinol** or a **retinyl ester** to affect cellular differentiation. PTCA has no or little effect on improving **skin** benefit when used alone; a substantial increase in **skin** benefit is only realized when PTCA is combined with **retinol** or a **retinyl ester**. In short, the present invention is based, at least in part, on the discovery of synergistic interaction between **retinol** or a **retinyl ester** and PTCA.

SUMM According to the present invention, by virtue of including an effective amount of PTCA into compositions containing **retinol** or a **retinyl ester**, the performance of the compositions is substantially improved. Alternatively, lower levels of **retinol** or a **retinyl ester** may be included in the composition containing PTCA to equal the performance of a similar formulation without the PTCA.

SUMM The inventive compositions contain, as a first essential ingredient, a compound selected from the group consisting of **retinol** or a **retinyl ester**.

SUMM The term "**retinol**" includes the following isomers of **retinol**: all-trans-**retinol**, 13-cis-**retinol**, 11-cis-**retinol**, 9-cis-**retinol**, 3,4-didehydro-**retinol**. Preferred isomers are all-trans-**retinol**, 13-cis-**retinol**, 3,4-didehydro-**retinol**, 9-cis-**retinol**. Most preferred is all-trans-**retinol**, due to its wide commercial availability.

SUMM **Retinyl ester** is an ester of **retinol**. The term "**retinol**" has been defined above. **Retinyl esters** suitable for use in the present invention are C.sub.1 -C.sub.30 esters of **retinol**, preferably C.sub.2 -C.sub.20 esters, and most preferably C.sub.2, C.sub.3, and C.sub.16 esters because they are more commonly available. Examples of **retinyl esters** include but are not limited to: retinyl palmirate, retinyl formate, retinyl acetate, retinyl propionate, retinyl butyrate, retinyl valerate, retinyl isovalerate,. . .

SUMM The **retinoid** is employed in the inventive composition in an amount of from about 0.001% to about 10%, preferably in an amount. .

. . .

DETD 2.5.times.10.sup.-7 M **retinoic acid** was very effective at repressing keratinocyte TG1 levels (to 44%) of control level. 2.5.times.10.sup.-7 M **retinol** was less effective than **retinoic acid** and 10.sup.-6 M oleanolic acid had only a very slight inhibitory effect on the keratinocyte TG1 level when used alone. However, 2.5.times.10.sup.-7 M **retinol**+10.sup.-6 M oleanolic acid repressed keratinocyte TG1 to 66% of control levels. Oleanolic acid and **retinol** therefore act synergistically to repress keratinocyte differentiation in an analogous manner to the effect of **retinoic acid.**

DETD In Examples 1-3, **retinoic acid** was used as positive control and reference compound against which the other compounds under analysis were compared. **Retinoic acid,** in a dose dependent manner increased thymidine incorporation and decreased transglutaminase I levels in **skin** keratinocytes. In other words **retinoic acid** decreased keratinocyte differentiation. **Retinol** was significantly less effective than **retinoic acid** at inhibiting keratinocyte differentiation.

DETD The unexpected result of this study however was that the effect of **retinol** on cultured keratinocytes can be enhanced to levels approaching those of **retinoic acid** by combining **retinol** with a PTCA. This effect was not only greater than the effect of either **retinol** or the PTCA itself but the two ingredients acted in synergy with each other to promote a **retinoic acid** response on the keratinocytes.

DETD The results in Examples 2 and 3 demonstrate that PTCA acts synergistically with **retinol** both to increase keratinocyte proliferation and decrease keratinocyte differentiation, mimicking the effect of **retinoic acid.**

CLM What is claimed is:

1. A **skin** conditioning composition comprising (a) from about 0.001% to about 10% of a **retinoid** selected from the group consisting of **retinol**, a **retinyl ester** and mixtures thereof; (b) from about 0.0001% to about 50% of a polycyclic triterpene carboxylic acid selected from the group. . .

2. The composition of claim 1 wherein the **retinyl ester** is selected from the group consisting of retinyl

palmitate, retinyl acetate, retinyl propionate, retinyl linoleate and mixtures thereof.

3. The composition of claim 1 wherein ingredient (a) is **retinol**.

4. The composition of claim 1 wherein ingredient (a) is a **retinyl ester**.

5. A method of conditioning **skin** the method comprising applying topically to **skin** the composition of claim 1.

6. A method of treating a **skin** condition selected from the group consisting of dry **skin**, photodamaged **skin**, appearance of wrinkles, age spots, aged **skin**, acne sebum control and **skin** lightening, the method comprising applying to the **skin** the composition of claim 1.

L10 ANSWER 3 OF 8 USPATFULL

AB Fatty acid amides in combination with azoles and either **retinol** or **retinyl ester** resulted in a synergistic enhancement in keratinocyte proliferation and synergistic inhibition of keratinocyte differentiation. The effects of the **retinol** or **retinyl esters** in combination with fatty acid amides and azoles were analogous to treatment with **retinoic acid**.

TI **Skin** care compositions containing fatty acid amides, azoles, and **retinol** or **retinyl ester**

PI US 5716627 19980210 <--

AB Fatty acid amides in combination with azoles and either **retinol** or **retinyl ester** resulted in a synergistic enhancement in keratinocyte proliferation and synergistic inhibition of keratinocyte differentiation. The effects of the **retinol** or **retinyl esters** in combination with fatty acid amides and azoles were analogous to treatment with **retinoic acid**.

SUMM **Retinol** (vitamin A) is an endogenous compound which occurs naturally in the human body and is essential for normal epithelial cell differentiation. Natural and synthetic vitamin A derivatives have been used extensively in the treatment of a variety of **skin**

disorders and have been used as **skin** repair or renewal agents. **Retinoic acid** has been employed to treat a variety **skin** conditions, e.g., acne, wrinkles, psoriasis, age spots and discoloration. See e.g., Vahlquist, A. et al., J. Invest. Dermatol., Vol. 94, Holland D. B. and Cunliffe, W. J. (1990), pp. 496-498; Ellis, C. N. et al., "Pharmacology of **Retinols** in **Skin**", Vasel, Karger, Vol. 3, (1989), pp. 249-252; Lowe, N. J. et al., "Pharmacology of **Retinols** in **Skin**", Vol. 3, (1989), pp. 240-248; PCT Patent Application No. WO 93/19743. **Retinol** and **retinyl esters**, such as retinyl acetate and retinyl palmitate, are easier to formulate/stabilize than **retinoic acid**. Unfortunately, **retinol** and **retinyl esters** are less effective than **retinoic acid** at providing **skin** benefits.

The present invention is based, in part, on the discovery that certain combinations of **retinol** or **retinyl esters** with fatty acid amides and azoles result in a synergistic improvement in keratinocyte proliferation and differentiation. The effects of combination of a fatty acid amide with azole and either **retinol** or a **retinyl ester** were analogous to the effects of **retinoic acid**. This effect was not only greater than the effect of either **retinol/retinyl ester** with a fatty acid amide or of **retinol/retinyl ester** with azole but the three ingredients acted in synergy with each other to promote a **retinoic acid** response. Thus, a mixture of fatty acid amides with **retinol** or **retinyl esters** mimics **retinoic acid** yet is easier to use than **retinoic acid**.

SUMM . . . from about 0.025% to about 35% of a monocarboxylic fatty acid, ester, or amide. The compositions may also include a **retinoid**; Thornfeldt teaches that certain **retinoids**, namely isotretinoin, tretinoin, errerin (all of which are stereoforms of **retinoic acid**) and etretinate (an ester of trimethoxyphenyl **retinoic acid**) have proven efficacy against papulosquamous diseases. PCT Application WO/9325177 (Procter and Gamble) discloses compositions for topical application to **skin** which contain a specific type of acyclic carboxamide coolant and may include **retinoids** such as **retinoic acid** and its derivatives (e.g., cis and trans). PCT application WO/9403156 (Rhone Poulenc) discloses a topical composition containing linoleic acid or a derivative as an active ingredient for treatment and prophylaxis of impure **skin** (e.g., **skin** affected by pimples, pustules, or comedones); the composition may also contain 0.025-0.1 wt. % of tretinoin. European Patent Application No.. . .

SUMM . . . (U.S. Pat. No. 5,216,148) disclose the use of specific complex carboxamides for treating and preventing neoplasms, dermatoses, and aging of **skin**. Van Scott et al. (U.S. Pat. No. 4,380,549) and Yu et al., (U.S. Pat. No. 4,363,815) disclose treatment of acne, dry, flaky, scaly **skin** with a hydroxyacid or the amide thereof. EP 582,458 discloses use of N,N-(1,4C alkyl) lauramide EP 559,304 disclose the use of an amide containing a hydrocarbyl chain of at least 25 carbon atoms as a **skin** smoothening agent. Beauquey et al. (U.S. Pat. No. 5,308,551) disclose a **skin** washing and conditioning composition containing, among other ingredients, a 1-4C alkanolamide of a 8-16C fatty acid. Great Britain Patent Specification. . .

SUMM Compositions containing **retinoids** and azoles nave been described. See for instance Yusuf et al., CA 2,101,101, Cauwenbergh, U.S. Pat. No. 5,476,852 and Keyhani,. . .

SUMM Compositions containing azoles and fatty acid amides are also known. These compositions, however, do not include any **retinoids**. See for instance, WO 95/17175; EP 0 347,199; U.S. Pat. No. 4,867,971; and U.S. Pat. No. 5,348,736.

SUMM The art cited above does not disclose **skin** conditioning compositions based on synergistic combinations of three ingredients: a fatty acid amide, an azole and **retinol** or a **retinyl ester**. None of the art cited above addresses the need for an effective alternative to **retinoic acid**.

SUMM The present invention includes, in part, a **skin** conditioning composition containing:

SUMM (a) from about 0.001% to about 10% of **retinol** or a **retinyl ester**;

SUMM The term "conditioning" as used herein means prevention and treatment of dry **skin**, photodamaged **skin**, appearance of wrinkles, age spots, aged **skin**, increasing stratum corneum flexibility, and generally increasing the quality of **skin**. The composition may be used to improve **skin** desquamation and epidermal differentiation.

SUMM The presence of the fatty acid amide and an azole in the inventive product substantially improves the performance of **retinol** or a **retinyl ester**, i.e., fatty acid amide in combination with azole substantially increases the ability of **retinol** or a **retinyl ester** to affect cellular proliferation and differentiation. The fatty acid amide or an azole has no or little effect on improving **skin** benefit when used alone; a substantial increase in **skin** benefit is only realized when the amide and the azole are combined with **retinol** or a **retinyl ester**. In short, the present invention is based, at least in part, on the discovery of synergistic interaction between **retinol** or a **retinyl ester**, fatty acid amides, and azoles.

SUMM . . . C.sub.8 -C.sub.24 fatty acid, most preferably a mono- or di-alkanolamide of a C.sub.8 -C.sub.24 fatty acid and the azole is **climbazole**.

SUMM . . . present invention, by virtue of including an effective amount of a fatty acid amide and an azole into compositions containing **retinol** or a **retinyl ester**, the performance of the compositions is substantially improved. Alternatively, lower levels of **retinol** or a **retinyl ester** may be included in the composition containing the fatty acid amide and the azole to equal the performance of a. . .

SUMM The inventive compositions contain, as a first essential ingredient, a compound selected from the group consisting of **retinol** or a **retinyl ester**. The term "**retinol**" includes the following isomers of **retinol**: all-trans-**retinol**, 13-cis-**retinol**, 11-cis-**retinol**, 9-cis-**retinol**, 3,4-didehydro-**retinol**. Preferred isomers are all-trans-**retinol**, 13-cis-**retinol**, 3,4-didehydro-**retinol**, 9-cis-**retinol**. Most preferred is all-trans-**retinol**, due to its wide commercial availability.

SUMM **Retinyl ester** is an ester of **retinol**. The term "**retinol**" has been defined above. **Retinyl esters** suitable for use in the present invention are C.sub.1 -C.sub.30 esters of **retinol**, preferably C.sub.2 -C.sub.20 esters, and most preferably C.sub.2, C.sub.3, and C.sub.16 esters

because they are more commonly available. Examples of **retinyl esters** include but are not limited to: retinyl palmitate, retinyl formate, retinyl acetate, retinyl propionate, retinyl butyrate, retinyl valerate, retinyl isovalerate,. . .

SUMM **Retinol** or **retinyl ester** is employed in the inventive composition in an amount of from about 0.001% to about 10%, preferably in an amount. . .

SUMM . . . preferably from 12 to 18 carbon atoms, because longer chain fatty acid amides are more beneficial for conditioning of the **skin**. In the most preferred embodiment of the invention, amides of essential fatty acids are employed because essential fatty acids provide nutrition for the **skin**. Examples of essential fatty acids include but are not limited to linoleic, linolenic, arachidonic, gamma-linolenic, homo-gamma-linolenic, and mixtures thereof. Linoleic. . .

SUMM **Climbazole**, miconazole, bifonazole, econazole, clotrimazole are most preferred. Also suitable for use in the present invention are 1,2,4-triazole, octyl triazole, ketoconazole,. . .

SUMM . . . for the active components in the composition, so as to facilitate their distribution when the composition is applied to the **skin**.

SUMM Optional **Skin** Benefit Materials and Cosmetic Adjuncts

SUMM . . . invention. Various types of active ingredients may be present in cosmetic compositions of the present invention. Actives are defined as **skin** benefit agents other than emollients and other than ingredients that merely improve the physical characteristics of the composition. Although not. . .

SUMM The composition according to the invention is intended primarily as a product for topical application to human **skin**, especially as an agent for conditioning and smoothening the **skin**, and preventing or reducing the appearance of wrinkled or aged **skin**
.

SUMM . . . a small quantity of the composition, for example from 1 to 5 ml, is applied to exposed areas of the **skin**, from a suitable container or applicator and, if necessary, it is then spread over and/or rubbed into the **skin** using the hand or fingers or a suitable device.

SUMM The topical **skin** treatment composition of the invention can be formulated as a lotion having a viscosity of from 4,000 to 10,000 mPas,.
. .

DETD **Retinoic acid** is more effective than **retinol** at altering keratinocyte differentiation state

DETD A. The effect on incorporation of .sup.3 H-thymidine .mu.g soluble protein 24 hours after the addition of **retinoic acid** or **retinol** at various concentrations was examined. The results that were obtained are summarized in Table 1A.

2.5 .times. 10.sup.9 M ROH +10.sup.8 M LA-DEA + 10.sup.7 M **Climbazole**	1.10 = 0.40 (72%)		0.009	0.000 0.000 0.000

n = 6

DETD 2.5.times.10.sup.-7 M **retinoic acid** was very effective at repressing keratinocyte TG1 levels (to 29%) of contol level whereas the more dilute 2.5.times.10.sup.-9 M **retinoic acid** was not as effective but still inhibited TG1 levels by 55%. 2.5.times.10.sup.-9 M **retinol**, 2.5.times.10.sup.-9 M **retinol**+10.sup.-8 M LADEA and 2.5.times.10.sup.-9 M **retinol**+10.sup.-8 M **climbazole** had no inhibitory effect on the keratinocyte TG1 level. However 2.5.times.10.sup.-9 M **retinol**+10.sup.-8 M LADEA+10.sup.-8 M **climbazole** significantly repressed keratinocyte TG1 to 83% of control levels. This inhibition was significantly greater than the control, ROH alone, ROH+LADEA and ROH+**climbazole** indicating that the three ingredients, i.e., ROH, LADEA and **climbazole** act synergistically to inhibit keratinocyte TG1 levels. This effect was even greater when the **climbazole** concentration was increased by 10.times., i.e., 2.5.times.10.sup.-9 M+10.sup.-8 M LADEA+10.sup.-7 M **climbazole**, which resulted in this combination inhibiting TG1 levels to 72% of control. **Retinol**, fatty acid amides and **climbazole** therefore act synergistically to repress keratinocyte differentiation in an analogous manner to the effect of **retinoic acid.**

DETD CLOTRIMAZOLE, LINOLEAMIDE-MEA AND **RETINOL** SYNERGISTICALLY ENHANCED KERATINOCYTE PROLIFERATION

DETD TABLE 4

EFFECT OF **RETINOL**, LINOLEAMIDE-MEA AND CLOTRIMAZOLE ON KERATINOCYTE THYMIDINE INCORPORATION

2.5 .times. 10.sup.9 M ROH + 10.sup.8 M				

* = 0.001
@ = 0.041

* = 0.176
@ = 0.853

. . .

DETD 2.5.times.10.sup.-9 M **retinoic acid** significantly increased keratinocyte thymidine incorporation by 28% over the ethanol control and by 15% over the 2.5.times.10.sup.-9 M **retinol** treatment. Both 2.5.times.10.sup.-9 M **retinol**+10.sup.-8 M linoleamide-MEA and 2.5.times.10.sup.-9 M **retinol**+10.sup.-8 M clotrimazole had a stimulatory effect on keratinocyte proliferation over the control but this effect was no greater than **retinol** on its own. However the combination of 2.5.times.10.sup.-9 M **retinol** +10.sup.-8 M linoleamide-MEA+10.sup.-8 M clotrimazole significantly increased keratinocyte proliferation over both the ethanol control and the 2.5.times.10.sup.-8 M **retinol** treatment by 29% and 16% respectively. Most unexpectedly the combination of 2.5.times.10.sup.-9 M **retinol**+10.sup.-8 M linoleamide-MEA+10.sup.-8 M clotrimazole also significantly increased keratinocyte proliferation over both the 2.5.times.10.sup.-9 M **retinol**+10.sup.-8 M linoleamide-MEA and 2.5.times.10.sup.-9 M **retinol**+10.sup.-8 M clotrimazole treatments by 21% and 17% respectively. **Retinol**, linoleamide-MEA and clotrimazole therefore, act synergistically to increase keratinocyte proliferation to levels which closely resemble the stimulatory effect of **retinoic acid**.

DETD Examples 1-4 demonstrate that **retinoic acid**, in a dose dependant manner, increased thymidine incorporation and decreased transglutaminase I levels in **skin** keratinocytes. In other words **retinoic acid** increased keratinocyte proliferation and decreased keratinocyte differentiation. In Examples 1-4, **retinoic acid** was used as positive control and reference compound against which the other compounds under analysis were compared. **Retinol** was significantly less effective than **retinoic acid** at inhibiting keratinocyte differentiation and completely ineffective at increasing keratinocyte proliferation.

DETD The unexpected results of Examples 1-4, however, were that the effect of

retinol on cultured keratinocytes can be enhanced to levels approaching those of **retinoic acid** by combining **retinol** or **retinyl ester** with a fatty acid amide and an azole, although an azole and a fatty acid amide each exerts little or. . . benefit on its own. The results documented above demonstrate that fatty acid amides in combination with azoles act synergistically with **retinol** or **retinyl ester**, both to increase keratinocyte proliferation and to decrease keratinocyte differentiation, mimicking the effect of **retinoic acid**.

DETD The unexpected result of this study was that the effect of **retinol** on cultured keratinocytes can be enhanced to levels approaching those of **retinoic acid** by combining **retinol** with a fatty acid amide and an azole. This effect was not only greater than the effect of either **retinol**+fatty acid amide or of **retinol**+azole but the three ingredients acted in synergy with each other to promote a **retinoic acid** type response.

DETD The results documented above demonstrate that fatty acid amides and azoles act synergistically with **retinol** both to increase keratinocyte proliferation and decrease keratinocyte differentiation, mimicking the effect of **retinoic acid**.

TI **Skin** care compositions containing melinamide and a **retinoid**
PI US 5693330 19971202 <--
AB Melinamide in combination with either **retinol** or **retinyl ester** resulted in a synergistic enhancement in keratinocyte proliferation. The effects of the **retinol** or **retinyl esters** in combination with fatty acid amides were analogous to treatment with **retinoic acid**.
SUMM The invention relates to **skin** care compositions containing melinamide and a **retinoid**, preferably **retinol** or **retinyl ester**.
SUMM **Retinol** (vitamin A) is an endogenous compound which occurs naturally in the human body and is essential for normal epithelial cell differentiation. Natural and synthetic vitamin A derivatives have been used extensively in the treatment of a variety of **skin** disorders and have been used as **skin** repair or renewal agents. **Retinoic acid** has been employed to treat a variety of **skin** conditions, e.g., acne, wrinkles, psoriasis, age spots and discoloration. See e.g., Vahlquist, A. et al., J. Invest. Dermatol., Vol. 94, Holland D. B. and Cunliffe, W. J. (1990), pp. 496-498; Ellis, C. N. et al., "Pharmacology of **Retinols** in **Skin**", Vasel, Karger, Vol. 3, (1989), pp. 249-252; Lowe, N. J. et al., "Pharmacology of **Retinols** in **Skin**", Vol. 3, (1989),

pp. 240-248; PCT Patent Application No. WO 93/19743. **Retinol** and **retinyl esters**, such as retinyl acetate and retinyl palmitate, are easier to formulate/stabilize than **retinoic acid**. Unfortunately, **retinol** and **retinyl esters** are less effective than **retinoic acid** at providing **skin** benefits. The present invention is based, in part, on the discovery that a combination of **retinol** or **retinyl esters** with melinamide results in a synergistic improvement in keratinocyte proliferation. The effects of melinamide combined with **retinol** or a **retinyl ester** were analogous to the effects of **retinoic acid**. Thus, a mixture of melinamide with **retinol** or **retinyl esters** mimics **retinoic acid** yet is easier to use than **retinoic acid**.

SUMM . . . from about 0.025% to about 35% of a monocarboxylic fatty acid, ester, or amide. The compositions may also include a **retinoid**; Thornfeldt teaches that certain **retinoids**, namely isotretinoin, tretinoin, etretin (all of which are stereoforms of **retinoic acid**) and etretinate (an ester of trimethoxyphenyl **retinoic acid**) have proven efficacy against papulosquamous diseases. PCT Application WO/9325177 (Procter and Gamble) discloses compositions for topical application to **skin** which contain a specific type of acyclic carboxamide coolant and may include **retinoids** such as **retinoic acid** and its derivatives (e.g., cis and trans). PCT application WO/9403156 (Rhone Poulenc) discloses a topical composition containing linoleic acid or a derivative as an active ingredient for treatment and prophylaxis of impure **skin** (e.g., **skin** affected by pimples, pustules, or comedones); the composition may also contain 0.025-0.1 wt. % of tretinoin. European Patent Application No.. . .

SUMM . . . (U.S. Pat. No. 5,216,148) disclose the use of specific complex carboxamides for treating and preventing neoplasms, dermatoses, and aging of **skin**. Van Scoff et al. (U.S. Pat. No. 4,380,549) and Yu et al., (U.S. Pat. No. 4,363,815) disclose treatment of acne, dry, flaky, scaly **skin** with a hydroxyacid or the amide thereof. EP 0 582 458 discloses use of N,N-(1,4 C alkyl) lauramide. EP 0. . . 559 304 disclose the use of an amide containing a hydrocarbyl chain of at least 25 carbon atoms as a **skin** smoothening agent. Beauquey et al. (U.S. Pat. No. 5,308,551) disclose a **skin** washing and conditioning composition containing, among other ingredients, a 1-4 C alkanolamide of a 8-16 C fatty acid. Great Britain. . .

SUMM The art cited above does not disclose **skin** conditioning compositions based on synergistic combinations of melinamide with **retinol** or a **retinyl ester**. None of the art cited above addresses the need for an effective alternative to **retinoic acid**.

SUMM Accordingly, it is an object of the present invention to provide a **skin** conditioning composition containing a combination of **retinol** or a **retinyl ester** with melinamide.

SUMM It is another object of the invention to provide a method of conditioning **skin** with a composition containing as an active system a mixture of melinamide with **retinol** or a **retinyl ester**.

SUMM It is yet another object of the invention to provide a substitute for **retinoic acid** in cosmetic compositions.

SUMM The above objects are attained by the present invention which includes, in part, a **skin** conditioning composition containing:

SUMM (a) from about 0.001% to about 10% of a **retinoid** selected from the group consisting of **retinol**, a **retinyl ester**, and **retinoic acid**;

SUMM The term "conditioning" as used herein means prevention and treatment of dry **skin**, photodamaged **skin**, appearance of wrinkles, age spots, aged **skin**, acne, **skin** lightening psoriasis, atopic dermatosis, increasing stratum corneum flexibility, and generally increasing the quality of **skin**. The composition may be used to improve **skin** desquamation and cellular proliferation.

SUMM The presence of melinamide in the inventive product substantially improves the performance of **retinol** or a **retinyl ester**, i.e., melinamide substantially increases the ability of **retinol** or a **retinyl ester** to affect cellular proliferation. Melinamide has no or little effect on improving **skin** benefit when used alone; a substantial increase in **skin** benefit is only realized when melinamide is combined with **retinol** or a **retinyl ester**. In short, the present invention is based, at least in part, on the discovery of synergistic interaction between **retinol** or a **retinyl ester** and melinamide.

SUMM In a preferred embodiment of the invention, a **retinoid** is selected from the group consisting of **retinol** or a **retinyl ester**. According to the present invention, by virtue of including an effective amount of melinamide into compositions containing **retinol** or a **retinyl ester**, the performance of the compositions is substantially improved. Alternatively, lower levels of **retinol** or a **retinyl ester** may be included in the composition containing melinamide to equal the performance of a similar formulation without the amide.

SUMM The inventive compositions contain, as a first essential ingredient, a compound selected from the group consisting of **retinol**, a **retinyl ester**, or **retinoic acid**.

SUMM The term "**retinol**" includes the following isomers of **retinol**: all-trans-**retinol**, 13-cis-**retinol**, 11-cis-**retinol**, 9-cis-**retinol**, 3,4-didehydro-**retinol**. Preferred isomers are all-trans-**retinol**, 13-cis-**retinol**, 3,4-didehydro-**retinol**, 9-cis-**retinol**. Most preferred is all-trans-**retinol**, due to its wide commercial availability.

SUMM **Retinyl ester** is an ester of **retinol**. The term "**retinol**" has been defined above. **Retinyl esters** suitable for use in the present invention are C.sub.1 -C.sub.30 esters of **retinol**, preferably C.sub.2 -C.sub.20 esters, and most preferably C.sub.2, C.sub.3, and C.sub.16 esters because they are more commonly available. Examples of **retinyl esters** include but are not limited to: retinyl palmirate, retinyl formate, retinyl acetate, retinyl propionate, retinyl butyrate, retinyl valerate, retinyl isovalerate,. . .

SUMM The term "**retinoic acid**" includes the following isomers of **retinoic acid**, all-trans-**retinoic acid**, 9-cis-**retinoic acid**, 13-cis-**retinoic acid**, all-trans-3,4-didehydro-**retinoic acid**, 13-cis-3,4-didehydroretinoic acid, 9-cis-3,4-didehydroretinoic acid, 9,13-di-cis-3,4-didehydroretinoic acid, 5,6-epoxyretinoic acid, 5,8-epoxyretinoic acid, 4-oxoretinoic acid, 4-oxo-13-cis-**retinoic acid**.

SUMM The **retinoid** is employed in the inventive composition in an amount of from about 0.001% to about 10%, preferably in an amount. . .

SUMM Optional **Skin** Benefit Materials and Cosmetic Adjuncts

SUMM . . . invention. Various types of active ingredients may be present in cosmetic compositions of the present invention. Actives are defined as **skin** or hair benefit agents other than emollients and other than ingredients that merely improve the physical characteristics of the composition.. . .

SUMM Yet another preferred optional ingredient is selected from azoles, e.g., **climbazole**, bifonazole, clotrimazole, ketoconazole, miconazole, econazole, itraconazole, fiuconazole, terconazole, butoconazole, sulconazole, lionazole and mixtures thereof.

SUMM The composition according to the invention is intended primarily as a product for topical application to human **skin**, especially as an agent for conditioning and smoothening the **skin**, and preventing or reducing the appearance of wrinkled or aged **skin** .

SUMM . . . a small quantity of the composition, for example from 1 to 5 ml, is applied to exposed areas of the **skin**, from a suitable container or applicator and, if necessary, it is then spread over and/or rubbed into the **skin** using the hand or fingers or a suitable device.

SUMM The topical **skin** treatment composition of the invention can be formulated as a lotion having a viscosity of from 4,000 to 10,000 mPas,. . .

DETD **Retinoic Acid** is More Effective Than **Retinol** at Increasing Keratinocyte Proliferation

DETD A. The effect on incorporation of .sup.3 H-thymidine .mu.g soluble protein 24 hours after the addition of **retinoic acid** or **retinol** at various concentrations was examined. The results that were obtained are summarized in Table 1.

DETD TABLE 1

Effect of **Retinoic Acid** (RA) and **Retinol** (ROH) on Keratinocyte Thymidine Incorporation

mean Thymidine incorp./.mu.g protein .+-. s.d | p value vs | p value vs | p value vs

. . .

DETD All concentrations of **retinoic acid** tested, i.e., 2.5.times.10.sup.-7 M, 2.5.times.10.sup.-8 and 2.5.times.10.sup.-9 M, significantly increased keratinocyte proliferation over both the ethanol control and each of the 2.5.times.10.sup.-7 M, 2.5.times.10.sup.-8 M and 2.5.times.10.sup.-9 M **retinol** treatments and they did so in a dose dependant manner. This is consistent with **retinoic acid** having a greater stimulatory effect on epithelial proliferation than **retinol**.

DETD Melinamide and **Retinol** Act Synergistically to Enhance Keratinocyte Proliferation

DETD TABLE 2

Effect of **Retinol** and Melinamide on
Keratinocyte Thymidine Incorporation

ROH. . .

DETD 2.5.times.10.sup.-8 M **retinoic acid** significantly increased keratinocyte thymidine incorporation by 30% over both the ethanol control and the 2.5.times.10.sup.-8 M **retinol** treatment. 10.sup.-7 M melinamide had no effect on keratinocyte proliferation on its own. However, the combination of 2.5.times.10.sup.-8 M **retinol**+10.sup.-7 M melinamide significantly increased keratinocyte proliferation over both the ethanol and the 2.5.times.10.sup.-8 M **retinol** treatments by 12% and 36% respectively. Melinamide and **retinol** therefore, act synergistically to increase keratinocyte proliferation mimicking the stimulatory effect of **retinoic acid**.

DETD The effect of melinamide and the **retinyl ester** (retinyl palmitate) on incorporation of .sup.3 H-thymidine was examined.

The results that were obtained are summarized in Table 3.

DETD TABLE 3

Effect of **Retinol** and Melinamide on
Keratinocyte Thymidine Incorporation

	mean Thymidine incorp/.mu.g protein .+-.	p value vs	p value vs.	p value	p value

DETD 2.5.times.10.sup.-7 M **retinoic acid** significantly increased keratinocyte thymidine incorporation over both the ethanol

control and the 2.5.times.10.sup.-7 M retinyl palmitate treatment by 38%. 10.sup.-7. . . keratinocyte proliferation over both the ethanol (by 16%) and the 2.5.times.10.sup.-7 M retinyl palmitate control treatments (by 12%). Melinamide and **retinol** therefore, act synergistically to increase keratinocyte proliferation mimicking the stimulator/effect of **retinoic acid.**

DETD Examples 1-3 demonstrate that **retinoic acid,** in a dose dependent manner, increased thymidine incorporation in **skin** keratinocytes. In other words **retinoic acid** increased keratinocyte proliferation. In Examples 1-3, **retinoic acid** was used as positive control and reference compound against which the other compounds under analysis were compared. **Retinol** was completely ineffective at increasing keratinocyte proliferation.

DETD The unexpected results of Examples 1-3, however, were that the effect of **retinol** on cultured keratinocytes can be enhanced to levels approaching those of **retinoic acid** by combining **retinol** or **retinyl ester** with melinamide--a compound which exerts little or no benefit on its own. The results documented above demonstrate that melinamide acts synergistically with **retinol** or **retinyl ester,** to increase keratinocyte proliferation, mimicking the effect of **retinoic acid.**

CLM What is claimed is:

1. A **skin** conditioning composition comprising (a) from about 0.001% to about 10% of a compound selected from the group consisting of **retinoic acid, retinol** and a **retinyl ester;** (b) from about 0.0001% to about 50% of melinamide; and (c) a cosmetically acceptable vehicle.

3. The composition of claim 1 wherein ingredient (a) is **retinol**.

4. The composition of claïm 1 wherein ingredient (a) is a **retinyl ester.**

5. A method of treating a **skin** condition selected from the group consisting of dry **skin,** photodamaged **skin,**

wrinkles, age spots, aged **skin**, acne, **skin** lightening, psoriasis and atopic dermatosis, the method comprising applying to the **skin** the composition of claim 1.

L10 ANSWER 6 OF 8 USPATFULL

AB Quercetin and/or naringenin in combination with either **retinol** or **retinyl ester** resulted in a synergistic inhibition of keratinocyte differentiation. The effects of the **retinol** or **retinyl esters** in combination with naringenin and/or quercetin were analogous to treatment with **retinoic acid**.

TI **Skin** care compositions containing naringenin and/or quercetin and a **retinoid**

PI US 5665367 19970909 <--

AB Quercetin and/or naringenin in combination with either **retinol** or **retinyl ester** resulted in a synergistic inhibition of keratinocyte differentiation. The effects of the **retinol** or **retinyl esters** in combination with naringenin and/or quercetin were analogous to treatment with **retinoic acid**.

SUMM The invention relates to **skin** care compositions containing specific flavonoids and a **retinoid**, preferably **retinol** or **retinyl ester**.

SUMM **Retinol** (vitamin A) is an endogenous compound which occurs naturally in the human body and is essential for normal epithelial cell differentiation. Natural and synthetic vitamin A derivatives have been used extensively in the treatment of a variety of **skin** disorders and have been used as **skin** repair or renewal agents. **Retinoic acid** has been employed to treat a variety of **skin** conditions, e.g., acne, wrinkles, psoriasis, age spots and discoloration. See e.g., Vahlquist, A. et al., J. Invest. Dermatol., Vol. 94, Holland D. B. and Cunliffe, W. J. (1990), pp. 496-498; Ellis, C. N. et al., "Pharmacology of **Retinols** in **Skin**", Vasel, Karger, Vol. 3, (1989), pp. 249-252; Lowe, N. J. et al., "Pharmacology of **Retinols** in **Skin**", Vol. 3, (1989), pp. 240-248; PCT Patent Application No. WO 93/19743. It is believed that the use of **retinol** or esters of **retinol** would be preferred over **retinoic acid**. **Retinol** is an endogenous compound which occurs naturally in the human body and is

essential for normal epithelial cell differentiation. **Retinol** is also considered much safer than **retinoic acid**. Esters of **retinol** hydrolyze in-vivo to produce **retinol** . **retinol** and **retinyl esters** are considered ,safer than **retinoic acid**. Unfortunately, **retinol** and **retinyl esters** are less effective than **retinoic acid** at providing **skin** benefits.

SUMM The present invention is based, in part, on the discovery that a combination of **retinol** or **retinyl esters** with specific flavonoids results in a synergistic inhibition in keratinocyte differentiation. The effects of the flavonoids (specifically, naringenin and quercetin) combined with **retinol** or a **retinyl ester** were analogous to the effects of **retinoic acid**. Thus, a mixture of the specific flavonoids with **retinol** or **retinyl esters** mimics **retinoic acid** yet is easier and safer to use than **retinoic acid**.

SUMM . . . lauroyl methionate and flavonoids (including naringenin and quercetin) to inhibit free radical formation. Compositions may also include .beta.-carotene (precursor of **retinol**). FR 2 687 572A discloses certain flavonoids (including naringenin) for protection of **skin** from singlet oxygen. .beta.-carotene or derivatives thereof may also be included. Meadowsweet extract containing flavonoids as radical scavengers is disclosed. . . treatment of acne with naringin and naringenin. These documents do not appear to disclose naringenin or quercetin in combination with **retinol** or **retinyl esters**, or the ability of such combinations to mimic the effect of **retinoic acid**.

SUMM The art cited above does not disclose **skin** conditioning compositions based on synergistic combinations of naringenin or quercetin with **retinol** or a **retinyl ester**. None of the art cited above addresses the need for an effective alternative to **retinoic acid**.

SUMM The above objects are attained by the present invention which includes, in part, a **skin** conditioning composition containing:

SUMM (a) from about 0.001% to about 10% of a **retinoid** selected from the group consisting of **retinol**, a **retinyl ester**, and mixtures thereof;

SUMM The term "conditioning" as used herein means prevention and treatment of dry **skin**, photodamaged **skin**, appearance of wrinkles, age spots, aged **skin**, acne, **skin** lightening, psoriasis, atopic dermatosis, increasing stratum corneum flexibility, controlling sebum excretion and generally increasing the quality of **skin**. The composition may be used to improve **skin** desquamation and cellular proliferation.

SUMM The presence of the flavonoid in the inventive product substantially improves the performance of **retinol** or a **retinyl ester**, i.e., the flavonoid substantially increases the ability of **retinol** or a **retinyl ester** to affect cellular proliferation. The flavonoid has no or little effect on improving **skin** benefit when used alone; a substantial increase in **skin** benefit is only realized when the flavonoid is combined with **retinol** or a **retinyl ester**. In short, the present invention is based, at least in part, on the discovery of synergistic interaction between **retinol** or a **retinyl ester** and the specific flavonoid.

SUMM According to the present invention, by virtue of including an effective amount of naringenin or quercetin into compositions containing

retinol or a **retinyl ester**, the performance of the compositions is substantially improved. Alternatively, lower levels of **retinol** or a **retinyl ester** may be included in the composition containing naringenin or quercetin to equal the performance of a similar formulation without the. . .

DETD The inventive compositions contain, as a first essential ingredient, a compound selected from the group consisting of **retinol** and a **retinyl ester**.

DETD The term "**retinol**" includes the following isomers of **retinol**: all-trans-**retinol**, 13-cis-**retinol**, 11 -cis-**retinol**, 9-cis-**retinol**, 3,4-didehydro-**retinol**. Preferred isomers are all-trans-**retinol**, 13-cis-**retinol**, 3,4-didehydro-**retinol**, 9-cis-**retinol**. Most preferred is all-trans-**retinol**, due to its wide commercial availability.

DETD **Retinyl ester** is an ester of **retinol**. The term "**retinol**" has been defined above. **Retinyl esters** suitable for use in the present invention are C.sub.1 -C.sub.30 esters of **retinol**, preferably C.sub.2-C.sub.20 esters, and most preferably C.sub.2, C.sub.3, and C.sub.16 esters because they are more commonly available. Examples of **retinyl esters** include but are not limited to: retinyl palmitate, retinyl formate, retinyl acetate, retinyl propionate, retinyl butyrate, retinyl valerate, retinyl isovalerate,. . .

DETD The **retinoid** is employed in the inventive composition in an amount of from about 0.001% to about 10%, preferably in an amount. . .

DETD . . . for the active components in the composition, so as to facilitate their distribution when the composition is applied to the **skin**.

DETD Optional **Skin** Benefit Materials and Cosmetic Adjuncts

DETD . . . invention. Various types of active ingredients may be present in cosmetic compositions of the present invention. Actives are defined as **skin** or hair benefit agents other than emollients and other than ingredients that merely improve the physical characteristics of the composition.. . .

DETD Yet another preferred optional ingredient is selected from azoles, e.g., **climbazole**, bifonazole, clotrimazole, ketoconazole, miconazole, econazole, itraconazole, fluconazole, terconazole, butoconazole, sulconazole, lionazole and mixtures thereof.

DETD The composition according to the invention is intended primarily as a product for topical application to human **skin**, especially as an agent for conditioning and smoothening the **skin**, and preventing or reducing the appearance of wrinkled or aged **skin**.

DETD . . . a small quantity of the composition, for example from 1 to 5 ml, is applied to exposed areas of the **skin**, from a suitable container or applicator and, if necessary, it is then spread over and/or rubbed into the **skin** using the hand or fingers or a suitable device.

DETD The topical **skin** treatment composition of the invention can be formulated as a lotion, a fluid cream, a cream or a gel. The. . .

DETD **Retinoic acid** is more effective than **retinol** at altering keratinocyte differentiation state

DETD The effect on Transglutaminase levels normalized to DNA content of the cells after addition of **retinoic acid** and **retinol** was examined and the results are shown in Table 1.

Retinoids were obtained from Sigma.

DETD All concentrations of **retinoic acid** tested, i.e., 2.5.times.10.sup.-8 M, 2.5.times.10.sup.-8 M and 2.5.times.10.sup.-9 M decreased keratinocyte differentiation over both the ethanol control and did so to a significantly greater extent than each of the corresponding 2.5.times.10.sup.-7 M, 2.5.times.10.sup.-9 M and 2.5.times.10.sup.-9 M **retinol** treatments. The decrease in transglutaminase level was dose dependent for both **retinoic acid** and **retinol**. This is consistent with **retinoic acid** having a greater inhibitory effect on epithelial differentiation than **retinol**.

DETD Naringenin and **Retinol** Synergistically Inhibit Keratinocyte Differentiation

DETD TABLE 2

Effect of **Retinol** and Naringenin on Keratinocyle TGase/DNA

2.5 .times. 10.sup.-7. . .

DETD It can be seen from the results in Table 4 that 2.5.times.10.sup.-7 M **retinoic acid** was effective at repressing keratinocyte TG1 levels (to 52%) of control level. 2.5.times.10.sup.-7 M **retinol** was ineffective (90%) and 10.sup.-6 M quercetin had only a small inhibitory effect on the keratinocyte TG1 level when used alone.

However, 2.5.times.10.sup.-7 M **retinol** +10.sup.-6 M quercetin repressed keratinocyte TG1 to 70% of control levels. Quercetin and **retinol** therefore acted synergistically to repress keratinocyte differentiation in an analogous manner to the effect of **retinoic acid**.

DETD During the course of these studies, **retinoic acid** was used as positive control and reference compound against which the other compounds under analysis were compared. **Retinoic acid**, in a dose dependant manner decreased transglutaminase I levels in **skin** keratinocytes. In other words, **retinoic acid** decreased keratinocyte differentiation. **Retinol** and retinyl palmitate were significantly less effective than **retinoic acid** at inhibiting keratinocyte differentiation.

DETD The unexpected result demonstrated by Examples 2-4 however was that the effect of **retinol** and retinyl palmitate on cultured keratinocytes can be enhanced to levels approaching those of **retinoic acid** by combining **retinol** with a flavonoid such as naringenin or quercetin. This effect was not only greater than the effect of either **retinol** or the flavonoid itself but the two ingredients acted in synergy with each other to promote a **retinoic acid**-type response on the keratinocytes.

DETD The results documented above demonstrate that naringenin and/or quercetin act synergistically with **retinol** and **retinyl esters** to decrease keratinocyte differentiation, mimicking the effect of **retinoic acid**.

L10 ANSWER 7 OF 8 USPATFULL
AB The present invention relates to a topical acne cream having primary ingredients such as: clortrimazole being an anti-fungal ingredient usually termed fungicidal due to its characteristic of killing fungus when they come in contact with the substance; betamethasone dipropionate

being an anti-inflammatory ingredient; and salicylic acid being an anti-septic/anti-bacterial/keratolytic substance which rapidly reduces inflammation caused by a person's body's immune reaction to acne bacteria as well as optional secondary ingredients such as binders, emulsifiers and fillers which may be present individually and in combination.

SUMM The present invention relates to the field of treating the **skin** condition known as acne. More specifically, the present invention is concerned with the prophylactic or therapeutic topical treatment of acne. Even more specifically, the present invention is concerned with the topical treatment of such **skin** disorders as acne vulgaris, other acneiform **dermal** disorders, e.g. preadolescent acne, acne rosacea (now known as rosacea), premenstrual acne, acne venenata, acne cosmetica, pomade acne, acne detergicans,. . . acne conglobata, or nodulocystic acne. The present invention can also be used for topically treating certain other types of acneiform **dermal** disorders, e.g. perioral dermatitis, seborrheic dermatitis in the presence of acne, gram negative folliculitis, sebaceous gland dysfunction, hiddradenitis suppurativa, pseudo-folliculitis. . .

SUMM . . . or thirties or may persist in adults for many years. Acne vulgaris most commonly occurs on oily areas of the **skin** with high sebaceous gland concentration. The areas of high sebaceous gland concentration are the face, ears, retroauricular areas (e.g. behind. . .

SUMM . . . eruptions can occur wherever there is a pilosebaceous unit or sebaceous follicle which does include the entire surface of the **skin**. The basic lesion in acne is the comedo commonly known as the blackhead. The comedo is created by retention of layers of dead **skin** known as keratin in the lining of the follicles. In addition to hyperkeratosis (which is thickening or retentative layering of. . .

SUMM Acne vulgaris can appear in many clinical varieties. The mildest case manifests comedones on oily **skin** and is called acne comedo.

SUMM This form of ache is common in adolescent **skin**, but it can be seen in all ages. The papular inflammatory form of acne can progress to an indurated, deeper,. . .

SUMM . . . acne which is manipulated or picked and causes further inflammation, more papules, and sometimes scars, pitting, and atrophy of the **skin**.

SUMM . . . mechanism is thought to be an inflammatory response to the end of hair (usually curly beard facial hair) into the **skin** causing a foreign body inflammatory response.

SUMM Hiddradenitis suppurativa is a suppurative (chronic) and cystic disease of apocrine gland regions of the **skin**, including the axillae,

perineum and groin.

SUMM . . . specifically, there is evidence for increased peripheral metabolic conversion of the androgen testosterone to dihydrotestosterone at the level of the **skin** in acne patients. It is further hypothesized that receptors on the sebaceous gland for the active androgen dihydrotestosterone can exhibit. . .

SUMM . . . present in abundance in pathologically affected sites. They are reduced during oral antimicrobial treatment, and their absence from nonhuman animal **skin** is striking especially since animals do not exhibit acne vulgaris.

SUMM Yet another causative factor in acne is the inflammatory response manifested in the **skin**. More specifically, it is thought that Proprionibacterium acnes lives in symbiosis on the keratin lined follicular canal. Proprionibacterium acnes ingests. . .

SUMM . . . lines 16-26, the bridged hyaluronic acid/cyanogen bromide/ampicillin conjugate, having been incorporated in a conventional medium, is applied directly to the **skin** to treat acne vulgaris. What may be risky about using this bridged hyaluronic acid/cyanogen bromide/ampicillin conjugate is that a quantity. . . after several rinses with absolute alcohol. Then, by applying some of this bridged hyaluronic acid/cyanogen bromide/ampicillin conjugate directly to the **skin** of patients, one may then be applying a residue of cyanogen bromide directly to the **skin** of patients.

SUMM . . . herein in the specification and claims is the acronym for Live Yeast Cell Derivative. The material is also known as **Skin** Respiratory Factor (SRF), Tissue Respiratory Factor (TRF), and Procytoxoid (PCO). The product, LYCD, is an alcoholic extract of viable Saccharomyces. . . 5 units to 40 units/mg of respiratory activity. In topical medicinal preparations it is characterized and quantified in terms of **Skin** Respiratory Factor (SRF) units. A unit of activity is calculated as the amount of SRF which is required to increase the oxygen uptake of 1 mg of dry weight rat abdominal **skin** by 1 percent at the end of a 1 hour testing period in a Warburg apparatus.

SUMM LYCD is also available as LYCODERM.RTM. ointment containing 2,000 units **Skin** Respiratory Factor (SRF) per ounce, from Arel Pharmaceuticals, Inc., Cincinnati, Ohio. In the prior art the well know hemorrhoidal ointment,. . . ounce of ointment. J. Z. Kaplan (Arch. Surge. 119(9) p. 1005-8 (1984) has reported that, in a double blind human **skin** graft study donor sites treated with LYCD ointment, statistically significant earlier angiogenesis and epitheliazation occurred as compared with donor sites. . .

SUMM . . . Cutis 17, 85-590 (1976), there is a substantial increase in the therapeutic effect when benzoylperoxide is used in combination with **retinoic acid**. Considerable disadvantages of such compositions are, however, that they frequently cause allergic contact dermatitis and/or that they are, in certain. . .

SUMM . . . the treatment of acne. Moreover, as a general rule, it is desirable to avoid oral therapy in the treatment of **skin** diseases whenever an effective topical treatment modality is available. Compositions, which are suitable for topical administration and which comprise benzoylperoxide. . .

SUMM . . . Although a positive effect was noted it was found that the numbers of Propionibacterium acnes and Staphylococcus epidermidis on the

skin were not altered, despite the in vitro activity of micronazole against Propionibacterium acnes.

SUMM 1-(4-chlorophenoxy)-1-(1H-imidazol-1-yl)-3,3-dimethyl butan-2-one, generically designated as **climbazole**;

SUMM . . . activities on an examplitory bacterium such as Staphylococcus epidermidis, and Propionibacterium acnes, which microorganisms may all be recovered from the **skin**-lesions caused by acne vulgaris.

SUMM A method and composition for topically treating acne and acneiform **dermal** disorders includes applying an amount of an antibiotic selected from the group consisting of ampicillin, amoxicillin, other aminopenicillins, and cephalosporin, and derivatives and analogs thereof, effective to treat the acne and acneiform **dermal** disorders. The antibiotic is blended with a carrier suitable for topical application to **dermal** tissues. The carrier is selected from the group consisting of an aqueous liquid, an alcohol base, a water soluble gel,. . .

SUMM . . . applicant has, surprisingly, discovered that particularly effective, stable compositions can be obtained for treatment of acne, cutaneous ulcers, warts and **skin** dyskeratinization, also for the general treatment of dermatoses and cutaneous disorders, wherein clotrimazole, betamethasone dipropionate and salicylic acid may be. . .

SUMM . . . the invention are suitable for treatment of cutaneous disorders and dermatoses, such as acne in particular, cutaneous ulcers, warts and **skin** dyskeratinization.

SUMM . . . present invention to provide topically applied pharmaceutical compositions suitable for the treatment of various ailments and physical conditions of the **skin** such as acne, bed sores, burns, infections, trauma, ulcers, wounds, and wrinkles.

SUMM Accordingly, it is an object of the invention to provide a new topical treatment for acne and acneiform **dermal** disorders.

SUMM . . . will avoid the undesirable side effects of the currently available oral antibiotics for the systemic treatment of acne and acneiform **dermal** disorders, such as diarrhea, abdominal cramping, nausea, vomiting, drug eruptions, photosensitivity, blood dyscrasia (e.g. depression of white blood cell count. . .

SUMM . . . with clotrimazole, betamethasone dipropionate and salicylic acid may be combined with binders, fillers, and emulsifiers and applied topically to the **skin** of a patient suffering from acne and other acneiform **dermal** disorders.

SUMM . . . with clotrimazole, betamethasone dipropionate and salicylic acid may be combined with binders, fillers, and emulsifiers and applied topically to the **skin** of a patient suffering from acne and other acneiform **dermal** disorders. Suitable cephalosporins include cefadroxil, cefazolin, cephalexin, cephalothin, cephapirin, cephradine, cefaclor, cefamandole, cefonicid, ceforanide, cefotetan (a cephamycin), cefoxitin (a cephamycin),. . .

SUMM In a first treatment regimen, topical compositions of the invention are used alone to treat the acne and acneiform **dermal** disorders. In this respect, the topical compositions of the invention can be used as a first line treatment for acne and acneiform **dermal** disorders.

SUMM In this respect, after a conventional regimen of treating a patient for acne or acneiform **dermal** disorders with an orally administered antibiotic, such as tetracycline, minocycline, doxycycline, erythromycin, wherein the patient develops resistance or no improvement,. . .

SUMM . . . peroxide and/or topical tretinoin and/or any other topical agent currently used by physicians in the treatment of acne and acneiform **dermal** disorders.

SUMM . . . theoretical explanation as to why the compositions and the methods of the invention are efficacious in treating acne and acneiform **dermal** disorders, presentation of certain theoretical concepts may be of value.

SUMM . . . emulsifiers qualities of the compositions employed and the fact that a portion of the topically applied is absorbed by the **skin** and enters the patient's bloodstream.

DETD . . . acid 22. When the topical acne cream 10 is applied to active acne 16B, the primary ingredients absorb into the **skin** through spaces between the cells as well as into the sebaceous glands and hair follicles, thus, permitting the active ingredients. . .

SUMM . . . Cutis 17, 585-590 (1976), there is a substantial increase in the therapeutic effect when benzoylperoxide is used in combination with **retinoic acid**. Considerable disadvantages of such compositions are, however, that they frequently cause allergic contact dermatitis and/or that they are, in certain. . .

SUMM . . . the treatment of acne. Moreover, as a general rule, it is desirable to avoid oral therapy in the treatment of **skin** diseases whenever an effective topical treatment modality is available. Compositions, which are suitable for topical administration and which comprise benzoylperoxide. . .

SUMM . . . Although a positive effect was noted it was found that the numbers of Propionibacterium acnes and Staphylococcus epidermidis on the **skin** were not altered, despite the in vitro activity of micronazole against Propionibacterium acnes.

SUMM 1-(4-chlorophenoxy)-1-(1H-imidazol-1-yl)-3,3-dimethylbutan-2-one, generically designated as **climbazole**;

SUMM . . . epidermidis B 2689 and B 180, and Propionibacterium acnes B 22, 267, which microorganisms may all be recovered from the **skin** -lesions caused by acne vulgaris.

SUMM . . . acne grading scale. Furthermore, comedones were counted and patients were questioned about side-effects such as, for example, irritation of the **skin**.

SUMM . . . azole derivative are administered separately. This mutually potentiating activity results in a decrease of the number of comedones in the **skin** of patients suffering from acne vulgaris when treated with a composition comprising benzoylperoxide and an azole derivative of formula (I),. . .

SUMM . . . compositions have the advantage that comparable and even higher activities are obtained at lower concentrations of benzoylperoxide, thus avoiding undesirable **skin** irritations while simultaneously effectively treating the acne.

SUMM . . . preferably be non-irritating and as far as possible they should be odorless and non-toxic. For convenience in applying to the **skin**, the compositions usually contain, besides from about 40 to about 90% of water or an organic solvent, several of certain. . .
